Explanation: . For a compound to be considered aromatic, it must be flat, cyclic, and conjugated and it must obey Huckel's rule. Huckel's rule states that an aromatic compound must have pi electrons in the overlapping p orbitals in order to be aromatic (n in this formula represents any integer). Only compounds with 2, 6, 10, 14, . . .

6. What is an atom? An atom is defined as the basic unit of a chemical element. A fundamental piece of matter. Plain simple and basic chemistry concept. Obviously we now know that atoms are made of smaller particles, called subatomic particles: protons (positively charged by convention), electrons (negatively charged by convention) and neutrons (neutral particles).
