A gas turbine, also called a combustion turbine, is a type of continuous and internal combustion engine. The main elements common to all gas turbine engines are: an upstream rotating gas compressor; a combustor; a downstream turbine on the same shaft as the compressor.; A fourth component is often used to increase efficiency (on turboprops and turboprops), to convert power into mechanical or ...

A turbocharger (technically a turbosupercharger), colloquially known as turbo, is a turbine-driven, forced induction device that increases an internal combustion engine's power output by forcing extra compressed air into the combustion chamber. This improvement over a naturally aspirated engine's power output is because the compressor can force more air—and proportionately more fuel—into ...

Dynamic viscosity: The SI physical unit of dynamic viscosity (μ) is the Pascal-second (Pa s), which is identical to $1 \text{ kg m}^{-1} \text{ s}^{-1}$. The physical unit for dynamic viscosity in the centimeter gram second system of units (cgs) is the poise (P), named after Jean Poiseuille. It is more commonly expressed, particularly in ASTM standards, as centipoise (cP).

In four-stroke cycle engines, both SI and CI, there are four strokes completing two rotations of the crankshaft. These are respectively the suction or charging, compression, power/work or expansion, and exhaust strokes. The important variable characterizing operational conditions in each engine is the brake mean effective pressure (b MEP), which is the mean effective pressure calculated from ...

Many of us didn't realise what had hit us when we scrambled to adjust to the sudden upheaval of the workplace, switching to remote work with little or no preparation, or deemed an essential worker and asked to continue business-as-usual in highly unusual circumstances.
